

1. Using the documentation for Recursive Feature Selection, apply this process to the crime dataset to create the best multivariate linear regression model
https://scikit-learn.org/stable/modules/generated/sklearn.feature_selection.RFE.html .
You can select what you're trying to predict, but be sure to indicate what that is. Be sure to explain what RFE is in the markdown. You should be able to answer this using what's on the documentation page + what you already know.
2. Create a list of preprocessing steps you should try when working to build a model. Briefly describe what each step is. Work with your group to come up with the most comprehensive list you can.
